FenyaWMS

Smarter Warehouse Management

FenyaWMS is a comprehensive, modular warehouse management solution designed to deliver accuracy, efficiency, and full visibility across your operations. By combining ERP integration, barcode scanning, and real-time data capture, FenyaWMS enables you to build a solution tailored to your needs and ensures your team can confidently manage every stage of warehouse operations — from goods receiving to last-mile delivery.

Inbound & Outbound Movements

Dispatch Module

With the Dispatch Module, you can guarantee that every order leaves your warehouse exactly as invoiced. Staff scan invoices directly onto handheld devices, check items against the order, and receive instant alerts if discrepancies occur. Box labels and courier details are automatically generated, ensuring a smooth handoff to delivery services. By validating every order before it leaves your warehouse, you reduce costly errors, improve customer satisfaction, and maintain accurate records.

Goods Receiving Module

The Goods Receiving Module ensures supplier deliveries are processed correctly the first time. Purchase orders are downloaded to scanners, allowing your team to check items against expected quantities and prevent over-receiving or incorrect items. Batch, serial, and expiry details can be captured for full traceability, either manually or directly from FenyaWMS barcodes. When complete, the system posts directly to your ERP to create supplier invoices or confirm receipts. This eliminates paperwork, reduces errors, and gives you real-time visibility into inbound stock.

Mobile Sales Module

Take your sales team out of the office and onto the road with FenyaWMS Mobile Sales. Using handheld scanners, reps can capture orders, scan product barcodes for validation, view live pricing, and process orders — all in real time or offline until internet is available. Orders sync directly into your ERP, keeping head office aligned. With features like digital signatures, your team can boost sales productivity while delivering an exceptional, modern buying experience for customers.

Job Cards Module

For project-based businesses, the Job Cards Module makes it easy to allocate and track stock per job. Staff can create jobs, issue stock with electronic signatures, and use stock remotely on site via mobile devices. All movements are tracked for full traceability, and invoices can be generated for used stock. This adds flexibility for field-based operations while keeping ERP data up to date.

Sales/Invoicing Picking Module

The Picking Module streamlines how your team fulfils sales orders. Sales orders are downloaded to handheld scanners, which guide staff to scan items against orders, preventing errors or over-picking. Variances are flagged immediately, with reasons captured for audit purposes. Once confirmed, the order updates directly into your ERP to generate invoices. This ensures stock moves quickly and accurately, speeding up order processing and helping you deliver on time, every time.

Stock Returns Module

The Stock Returns Module streamlines both customer credits and supplier returns, ensuring accuracy, compliance, and full traceability.

The **Credits Module** manages customer returns by syncing documents from your ERP into FenyaWMS, enabling operators to scan items against authorised quantities with strict validation rules. Batch, serial, and expiry details can be captured, while optional checklists and photographic evidence support compliance. Once complete, inventory levels are updated in real time, and automated notifications keep Accounts and Customer Service aligned for credit issuance or refunds.

The **Return to Supplier** Module simplifies supplier returns with controlled documents synced from your ERP or created directly in FenyaSA. Operators scan items with enforced validation rules, capture variance reasons, and attach supporting evidence where needed. Completed transactions update warehouse inventory and ERP records, while automated notifications and detailed RTS reports provide visibility for Procurement and Finance.

“From receiving to returns, FenyaWMS inbound and outbound modules work seamlessly to validate, track, and streamline every movement in your warehouse — ensuring accuracy, efficiency, and full visibility across the entire supply chain.

Internal Movements

Bill of Materials Module

Bring barcode scanning into your manufacturing process. The Bill of Materials Module lets you generate work orders, track production in real time, and allocate raw materials batches to finished goods. Manufactured stock is created instantly, and labels can be printed for pallets or units. With full batch traceability, compliance and quality control are guaranteed.

Stock Take Module

Turn cycle counts into a seamless process. The Stock Take Module downloads snapshots to barcode scanners, allowing staff to quickly scan items, quantities, or weights. Variances are reported immediately, with details on counted and uncounted items. Results can be updated directly into your ERP — no importing, no errors, no double capture. Additional reporting shows cost variances and historical trends, helping you measure and improve stock control over time.

Inter-Branch Transfers Module

Moving stock between branches can be risky without proper tracking. FenyaWMS Inter-Branch Transfers Module ensures accuracy by recording goods into a transit warehouse during the journey. At the destination, items are rescanned to confirm receipt. This guarantees both sending and receiving branches agree on what left, what arrived, and when — eliminating disputes and maintaining accurate records.

Inventory Adjustments Module

Adjusting stock levels is a fact of warehouse life — whether it's correcting counts, adjusting for damaged goods, or reallocating batches. FenyaWMS supports inbound, outbound, and batch-level adjustments with full bin, serial, and batch support. Every change is logged and posted to the ERP & WMS with journal entries, ensuring transparent reporting and audit trails. This prevents "mystery stock movements" and helps you maintain compliance. This module can also be used in standalone set ups to manage movements in and out of the warehouse.

Stock Transfer Module

Say goodbye to lost paperwork and unrecorded transfers. With the Stock Transfer Module, every movement between warehouses is scanned and logged in real time, updating your ERP & WMS immediately. Additional details like batch, serial, signatures, and delivery information can be captured for full traceability. Built-in reporting lets you analyse transfers across sites, improving accountability and visibility.

Traceability & Efficiency

Batch Tracking Module

Ensure compliance and reduce risk with full batch traceability. FenyaWMS records batch numbers for every stock movement, tracks expiry dates, and enforces FIFO principles. With detailed reporting on batch history, usage, and expiry, you gain total visibility. GS1 barcode support makes labelling and scanning fast and accurate. This is critical for industries where quality and compliance are non-negotiable.

Bin Management Module

Optimise your warehouse layout and picking efficiency with Bin Management. Products can be linked to multiple bins, with the system intelligently guiding staff where to store or pick items. This reduces walking time, eliminates guesswork, and ensures bins are always at the right levels. Printed bin barcodes make scanning quick and accurate, further reducing errors.

Order Tracking Module

Gain complete visibility into order progress with FenyaWMS Order Tracking. Every stage of an order — from creation through picking, packing, and delivery — is timestamped, monitored, and reported. Live dashboards let you track orders in real time, filter by process stage, and analyse staff and process performance. With these insights, you can identify bottlenecks, improve speed, and enhance your customer experience.

Proof of Delivery Module

Digitise your delivery process with FenyaWMS Proof of Delivery. Drivers receive routes and invoices on their devices, capture electronic signatures, and automatically update delivery statuses with timestamps and geolocation. PODs are instantly stored, re-printable, and emailed to customers, reducing paperwork and speeding up dispute resolution. Partial deliveries, damages, and returns can also be logged, giving you a complete picture of every delivery.

Courier Integration Module

Simplify logistics with Courier Integration. FenyaWMS links directly to your courier's system, generating waybills, parcel labels, and shipment details directly from invoices. No more duplicate data entry or missed shipments. Staff can also resubmit or cancel shipments directly from the module, keeping logistics fast and flexible.

Route/Load Planning Module

Optimise routes and maximise truck utilisation with the Route/Load Planning Module. From a single screen, managers can shuffle orders into logical routes by area, customer, weight, or value. Consolidated picking slips, delivery schedules, and trip sheets are generated instantly. Advanced features like pallet capture, truck size allocation, and profitability reports ensure vehicles are used efficiently, reducing costs and improving delivery performance.

Stock Detail Module

All the information you need, in one scan. The Stock Detail Module lets staff instantly view sales history, transactional records, current stock levels (by warehouse, bin, and batch), pricing, and master data. This ensures quick decision-making and empowers staff to answer customer queries confidently.

Serial Number Tracking Module

For businesses requiring high accountability, the Serial Number Tracking Module provides end-to-end visibility. Every stock movement is logged against serial numbers, making it easy to trace items from supplier receipt through customer delivery. Reports provide detailed history by serial number, improving accountability and compliance.

Utility Modules

Item Barcode Generator (Stock Detail Module)

Maintain your product master data with ease. The Item Barcode Generator allows staff to generate and manage product barcodes directly from Android devices. Updates happen in real time, eliminating delays from incomplete or outdated master data.

Barcode Label Printing Module

Not all goods arrive with scannable barcodes. With FenyaWMS, you can print barcode labels directly from purchase orders or ERP item data, including batch, serial, expiry, and item details. This ensures every product in your warehouse can be scanned, tracked, and managed seamlessly.

Multi-Warehouse Module

If you operate multiple warehouses, FenyaWMS makes management easy. The Multi-Warehouse Module allows you to create, track, and manage stock across multiple locations, with seamless integration into transfers and inter-branch processes. Even if your ERP doesn't support multi-warehousing, FenyaWMS fills the gap, ensuring complete visibility and control across your entire network.

Multi Company Module

Simplify operations across multiple businesses. The Multi Company Module allows users to switch between ERP environments without creating duplicate profiles or setups. This reduces IT overhead and makes it easier for staff to work across divisions.

Why Choose FenyaWMS

Accuracy at Scale
Barcode validation ensures error-free transactions.

ERP Integration
Real-time posting into financials, inventory, and sales.

Efficiency Gains
Eliminate paperwork, speed up workflows, and reduce overhead.

Full Traceability
Batch, serial, bin, and order tracking for complete compliance.

Scalability
From single warehouse operations to multi-site enterprises.

> **FenyaWMS gives you control, clarity, and confidence in your warehouse operations — from goods in, to goods out, and everything in between.**
